Node JS – Pure Node

The following exercise contains the following subjects:

- ◆ Pure Node

Instructions

Lets create a simple back-end server without the help of express.
Lets create it in pure node.

Setup:

- Create an HTTP server using only node.
- Listen to that server with a specific port using only node.
- Allow only GET requests to the server.

Routes:

["/raw-html"](#)

Return to the client some simple html. For example:

```
<h1>Welcome</h1>
```

["/users"](#)

Create a users.json file with some hard coded json data of users.

Return to the client that json file.

“/”

Create an index.html file.

Add to the html document an index.css and index.js file.

Return to the client the index.html file.

Bonus

If the user goes to e.g. localhost:3000/index.css or to localhost:3000/index.js send them the proper files back.
