

Little Express Crud

Using the routes you created in the last exercise complete the following:

Create an array of numbers for example [1,2,3,4,5,6] that will be set in your global scope.

GET

- With your get route, return the array of numbers to the client

POST

- With your post route, create a new number that you are getting from the **body** and append it to your array of numbers, send the array back to the client

DELETE

- With your delete route, get the number you want to remove from your **params**, remove the number from your array of numbers, send the array back to the client

PUT

- With your put route, get the number you want to remove from your **params**, get the new number you want to be replaced from your **body**, modify the number from your array of numbers, send the array back to the client.

Error handling <3

If the user tries to post a number that already exists in your array send a status 400 to the user saying the number already exists

If the user tries to delete a number that doesn't exist in your array, send a status 400 to the user saying the number doesn't exist

If the user tries to update a number that doesn't exist, send a status 400 to the user saying the number doesn't exist

Tips:

Do not make any copies of the array of numbers. Mutate the array directly.
